                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plasmid DNA from the normalized library NC1_CGAP_Col0 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1057416-1061255, and 1144584-1143351). Subtraction by Bento Soares and M. Fatima Bonaldo. a 93 c 108 g 87 t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Forward primer B9-131F and reverse primer B9-131R (see AAV31984) were used in RT-PCR assays of cDNA libraries of various human tissues to determine human Down syndrome-cell adhesion molecule DS-CAM (see AAV31981 and AAV31988) expression. The results demonstrated expression of human DS-CAM mRNA in foetal and adult brain, and foetal kidney. In addition, a breast carcinoma cell line showed expression of human DS-CAM mRNA. DS-CAM polypeptides (see AAW42086-87) are associated with developmental and neurological processes. The polypeptides and nucleic acids are used to developmental products for the detection, diagnosis and therapy of developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ches_

Further clones were obtained by exon cc trapping. The complete DS-CAM1 cDNA sequence was deduced from CC overlapping clones. A splice variant cDNA (see AAV31988), encoding commembrane bound DS-CAM2 (see AAW42087), was also identified. The DS-CAM gene spans 900-1200 kb of genomic DNA and maps at chromosome CC 21q22.2-22.3. The invention also provides murine DS-CAM partial CC sequences (see AAV31985-87), expression vectors and host cells, cc and separation of DS-CAM nucleic acid. D:-CAM polypeptides are CC associated with developmental and neurologic | processes. They can complete the set of the capy of developmental and neurologic | processes. They can complete the set of the corpus callosum, or schizencephaly. Antisense oligonucleotides are clown syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides are closed for inhibiting translation of mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                    1987
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neural cell adhesion molecules. A modified direct cDNA selection technique was applied to bacterial and Pl artificial chromosomes between ETS2 and MX1 by using cDNA from trisomy 21 human foetal brain. A unique cDNA fragment, designated E51 (see AAV31982), was obtained and used to screen a trisomy 21 human foetal brain (14-w

DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (requerrating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and
                                                                                                                                                                                                                                                                                                                                                                                                                  neural cell adhesion molecules. The middle region (see AAV31986) and 5 region see AAV31985) of the clone also provided. The murine DS-CAM clone was isolated from a C57 Black/6 mouse brain cDNA library using huma. DS-CAM cDNA (see AAV31981 and AAV31988) probe. The invention also provides human DS-CAM proteins (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           develop products for detection, diagnosis and therapy of developmental and neurological abnormalities
                                                                                                                                                                                                                          therapy of developmental and neurological abnormalities such as Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This
                                                                                                                                                                                                                                                                                                                                                                                             probe. The invention also provides numerican process.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel nucleic acid molecule (I) encoding a fructosyl transferase isolated from Aspergillus sydowi. The fructosyl transferase is useful for the production of polyfructose. Polyfructose can be used to manufacture surfactants, to increase the viscosity of an aqueous system, as a suspending agent, to accelerate sedimentation and in the formation of complexes or to bind water. The host cell can be used as a food. This sequence encodes the A. sydowi fructosyl transferase designated aff-SSY which is described in the method of the invention.
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 *GS* sequences given in AAR19001-726837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1b; Page 12-15; 28pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                             The inventors claim an MD probe comprising a purified ss NA:SQ which hybridises to at least a part of the MD gene; pure dystrophin (DS) polypeptide, purified NA encoding DS and antibodies (Ab) to DS. The probes are equal to or greater than 10b of one of 12 cDNA sequences deposited as ATCC 58666-57677. The MD gene is human, or a murine Dmd deposited as ATCC 58666-57677.
                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence of human muscular dystrophy (MD) cDNA.

                                                                                                                                                                                                                                                                                             The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene
                                                                                                                                                                                                                                               expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAI25968 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe
                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire with continuous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human geno

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-OCT-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to movel single exon nucleic acid probes. The probes are useful for the present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the prob hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast particularly those diseases with polygenic aeticlogy. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and processing the processing the present cancer.
                                                                                                                                                                                                                                                                                                                                                                                                          09-AUG-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic L. acids of determined algal, archaeal, bacterial, fungal and parasitical CC species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more CC used for producing probes and/or primers for detecting one or more CC related microorganisms e.g. algae, archaea, bacteria, fungi and CC parasites, for universal detection and for specific and ubiquitous CC detection and identification of an algal, archaeal, bacterial, fungal CC and parasitical species, genus, family and group. A nucleic acid (1) CC obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the CC detection of at least one antimicrobial agent resistance gene or at CC ubiquitous detection and for identification of the specific and CC ubiquitous detection and for identification of the specific and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification of series and cc ubiquitous detection and for identification. For a series and cc ubiquitous detection and combine adiacens, Bordeteix against microparation and combine and combin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Weisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Species specific; genus specific; family specific; probe; detection identification; algal; archaeal; bacterial; fungal; parasitical; microorganism; diagnosis; translation elongation factor Tu; toxin; translation elongation factor G; RecA recombinase; resistance; catalytic subunit of proton-translocating ATPase; antimicrobial;
